The image shows a banner for C-CAN. On the left, the text 'C-CAN' is written in large, blue, sans-serif font. Below it, 'California Current Acidification Network' is written in a smaller, white, sans-serif font. The background of the banner is a photograph of several people in a field, possibly a coastal area, wearing jackets and hats, engaged in some activity. The overall tone is professional and scientific.

## ***What is C-CAN?***

C-CAN is an *ad hoc* collaboration of academic scientists, commercial fishing and aquaculture interests together with state and federal resource managers who came together in an effort to better understand the drivers of ocean acidification along the US West Coast, and its likely impacts on organisms along the coast.

It grew out of a workshop held in Costa Mesa, CA in July 2010 to talk about *Ocean Acidification Impacts on Shellfish*.

# C-CAN

California Current Acidification Network

Inventory of assets relevant to ocean acidification. Compiled by the West Coast IOOS Regional Associations (NANOOS, CeNCOOS, SCOOS).

Group 1: Carbon Parameters (e.g., pH, pCO<sub>2</sub>, DIC, TA)  
Group 2: T, S, O

## ***Problem***

Much current carbon chemistry data along the US West Coast are unsuitable for the needs of C-CAN stakeholders

- Carbon chemistry often not measured at locations that coincide with biological studies
- Existing measurements not of uniform quality
- Predictive models not available on local scales

**C-CAN was initiated (in part) to develop a network that integrates biological and chemical monitoring**

**C-CAN**

California Current Acidification Network

**Has held 3 workshops within past 15 months bringing these disparate stakeholders together**

*July 2011                      Costa Mesa, CA*

*December 2011          Palo Alto, CA*

*August 2012                La Jolla, CA*

**Supported by a grant  
to UC San Diego from the**

MOORE  
FOUNDATION**

The image shows a banner at the top of a slide. On the left, the text 'C-CAN' is written in large, blue, sans-serif font. Below it, 'California Current Acidification Network' is written in a smaller, white, sans-serif font. The background of the banner is a photograph of several people in outdoor gear, including orange and grey jackets and red hats, working in a field. They appear to be collecting samples or conducting field research. The field is covered with what looks like seaweed or similar marine vegetation. In the background, there are some structures and a body of water under a hazy sky.

## *Progress*

Various stakeholders are now talking regularly with each other and see themselves as involved with C-CAN

This has resulted in enhanced attention from the management community

There has been broad agreement on various technical aspects of establishing an observing network

## ***What to measure? Where? Data handling?***

Measurements are required that enable the aragonite saturation state of seawater to be determined with an overall uncertainty of  $\pm 0.2$ , and that also enable a complete description of the seawater CO<sub>2</sub> system – including p(CO<sub>2</sub>) and pH.

The focus should be on the waters along the shore line, particularly in places where they can better inform co-located biological studies.

The regional associations of IOOS could provide an appropriate data handling and dissemination mechanism for this C-CAN network.

## ***What is still needed for this to happen?***

Need explicit guidance for potential participants (at a variety of levels of expertise) as to how best to make such such measurements.

- What available instruments can achieve these goals?
- How should they be used? (Methods / Training)
- How should the resulting data be reported?
- What data synthesis will increase its value to users?

C-CAN is working (together with others) to document this information and to plan (and seek support) for the necessary training and other essential infrastructure.
